AC/DC Convertor IC

PWM Type DC/DC Converter IC
Built-in Switching MOSFET for Non-Isolated Type

BM2P134Q-Z  BM2P137QK-Z

General Description
The PWM type DC/DC converter for AC/DC provides an optimum system for all products that include an electrical outlet. It enables simpler design of a high effective converter specializing in non-isolated devices. This series has a built-in starter circuit that tolerates 650 V / 800 V, and it contributes to low power consumption. With a current detection resistor for switching as internal device, it can be designed as small power supply. Since current mode control is utilized, current is restricted in each cycle and excellent performance is demonstrated in bandwidth and transient response. The oscillation frequency is fixed to 100 kHz. A frequency hopping function is also on chip, and it contributes to low EMI. In addition, a built-in superjunction MOSFET which tolerates 650 V / 800 V makes the design easy.

Features
- PWM Current Mode Method
- Frequency Hopping Function
- Burst Operation at Light Load
- Built-in 650 V / 800 V Starter Circuit that Tolerates
- Built-in 650 V / 800 V Super Junction MOSFET
- VCC Pin Under Voltage Protection
- VCC Pin Over Voltage Protection
- Over Current Limiter Function per Cycle
- Soft Start Function

Key Specifications
- Power Supply Voltage Operation Range
  - VCC: 10.60 V to 14.05 V
  - DRAIN: 650 V / 800 V (Max)
- Pulse Operation Current 1.20 mA (Typ)
- Burst Operation Current 0.45 mA (Typ)
- Oscillation Frequency 100 kHz (Typ)
- Operation Temperature Range -40 °C to +105 °C
- MOSFET ON Resistor
  - BM2P134Q-Z: 4.0 Ω (Typ)
  - BM2P137QK-Z: 7.5 Ω (Typ)

Package
DIP7K
9.27 mm x 6.35 mm x 8.63 mm
pitch 2.54 mm

Applications
LED Lights, Air Conditioners, Cleaners etc.

Typical Application Circuit

Description of Blocks

1 Back Converter
This is the IC for exclusive use of non-isolated type back converter.

<Basic operation of back converter>

1.1 When the MOSFET for Switching is ON
When the MOSFET turns ON, current $I_L$ flows to coil $L$ and energy is stored. At this moment, the voltage of the GND_IC pin becomes the voltage near the DRAIN pin, and the diode D1 is OFF.

$$I_L = \frac{(V_{IN} - V_{OUT})}{L} \times ton$$

Where:
$V_{IN}$ is the DRAIN Voltage
$V_{OUT}$ is the Output Voltage
$I_L$ is the Inductor Current
$ton$ is ON-Time of MOSFET

Figure 1. Back Converter Operation (MOSFET=ON)
1 Back Converter – continued

1.2 When the MOSFET for Switching is OFF
When the MOSFET turns OFF, the energy stored in coil is output via diode. At the moment, the MOSFET is OFF.

\[ I_L = \frac{V_{OUT}}{L} \times toff \]

Where:
- \( V_{OUT} \) is the Output Voltage
- \( I_L \) is the Inductor Current
- \( toff \) is OFF-Time of MOSFET

Figure 2. Back Converter Operation (MOSFET=OFF)
2 Start Sequences

Start sequences are shown in Figure 3. See the sections below for detailed descriptions.

A: The input voltage is applied to the DRAIN pin and the VCC pin voltage rises.
B: If the VCC pin voltage exceeds $V_{UVLO1}$, the IC starts to operate. And if the IC judges the other protection functions as normal condition, it starts switching operation.
   The soft start function limits the over current limiter value to prevent any excessive voltage or current rising.
   When the switching operation starts, the VOUT rises.
C: Until the VOUT becomes constant value from starting-up, the VCC pin voltage drops by the VCC pin consumption current.
D: After switching starts, it is necessary that the output voltage is set to rating voltage within $t_{FOLP1}$ (128 ms Typ).
E: At light load, the IC starts burst operation to restrict the consumption power.
F: When the load exceeds a certain electric power, the IC starts over load operation.
G: If the setting over load status lasts for $t_{FOLP1}$ (128 ms Typ), switching is turned OFF.
H: When the VCC pin voltage becomes less than $V_{CHG1}$, recharge operation is started.
I: When the VCC pin voltage becomes more than $V_{CHG2}$, recharge operation is stopped.
J: After $t_{FOLP2}$ (512 ms Typ), the over load protection circuit starts switching.
K: Same as G.
Description of Blocks – continued

3 Stop Sequences
Stop sequences are shown in Figure 4.

Figure 4. Stop Sequences Timing Chart

A: Normal operation
B: The input AC voltage is stopped. The DRAIN voltage starts to drop.
C: If the DRAIN voltage drops below a certain voltage, it becomes maximum duty and over load protection operates.
D: If the output voltage drops, the VCC pin voltage drops too. And recharge operation is started.
E: The recharge operation is stopped.
F: If the DRAIN voltage drops below a certain voltage, the VCC pin voltage lowers UVLO or less in order to stop recharge operation.
Description of Blocks – continued

4 Start Circuit
This IC enables low standby electric power and high-speed startup because it has a built-in start circuit. The consumption current after startup is only idling current $I_{\text{START}}$ (Typ=10 $\mu$A). The startup current flows from the DRAIN pin.

![Start Circuit Diagram](image)

**Figure 5.** Start Circuit

**Figure 6.** Startup Current vs VCC Voltage

![Startup Current vs VCC Voltage Diagram](image)
Description of Blocks – continued

5 The VCC Pin Protection Function

This IC has the internal protection function at the VCC pin shown in below.

1) Under voltage protection function UVLO
2) Over voltage protection function VCC OVP
3) VCC recharge function

5.1 VCC UVLO / VCC OVP Function

VCC UVLO function and VCC OVP function are auto recovery type comparators that have voltage hysteresis. VCC OVP has an internal mask time. If the condition that the VCC pin voltage is higher than \( V_{OVP1} \) lasts for \( t_{COMP} \) (100 µs Typ), it performs detection. The recovery requirements are that the VCC pin voltage is lower than \( V_{OVP2} \).

5.2 VCC Recharge Function

If the VCC pin drops to \( V_{CHG1} \) after once the VCC pin becomes more than \( V_{UVLO1} \) and the IC starts to operate, the VCC charge function operates. At that time, the VCC pin is charged from the DRAIN pin through start circuit. When the VCC pin voltage is more than \( V_{CHG2} \), charge is stopped.

![Figure 7. VCC UVLO / VCC OVP / VCC Recharge Function Timing Chart](image)

A: The input voltage is applied to the DRAIN pin and the VCC pin voltage rises.
B: When the VCC pin voltage becomes higher than \( V_{UVLO1} \), the IC starts operating. And if the IC judges the other protection functions as normal condition, it starts switching operation. The soft start function limits the over current limiter value to prevent any excessive voltage or current rising. When the switching operation starts, the VOUT rises.
C: When the VCC pin voltage becomes higher than \( V_{OVP1} \), VCC OVP timer operates.
D: When the condition that the VCC pin voltage is higher than \( V_{OVP1} \) lasts for \( t_{COMP} \) (100 µs Typ), the IC detects VCC OVP and stops switching.
E: When the VCC pin voltage becomes lower than \( V_{OVP2} \), VCC OVP is released.
F: When the input power supply is turned OFF, the DRAIN pin voltage drops.
G: When the VCC pin voltage becomes less than \( V_{CHG1} \), recharge function is started.
H: When the VCC pin voltage becomes higher than \( V_{CHG2} \), recharge function is stopped.
I: When the VCC pin voltage becomes lower than \( V_{CHG1} \), recharge function is started. However, the supply to the VCC pin decrease and the VCC pin voltage drops because of low DRAIN voltage.
J: When the VCC pin voltage becomes lower than \( V_{UVLO2} \), VCC UVLO function starts operating.
Description of Blocks – continued

6 DC/DC Driver
This performs current mode PWM control. An internal oscillator sets a fixed oscillation frequency $f_{SW}$ (100 kHz Typ). This IC has a built-in oscillation frequency hopping function. The maximum duty is $D_{MAX}$ (75 % Typ). To achieve the low consumption power at light load, it also has an internal burst mode circuit.

6.1 Setting of the Output Voltage
Adopting the non-isolated type without photo coupler, the VCC voltage should be set to rating value. VCC Voltage means the voltage between the VCC pin and the GND_IC pin. The output voltage $V_{OUT}$ is defined by the formula below. The voltage when the MOSFET is OFF is shown in Figure 8.

$$V_{OUT} = V_{CNT} + V_{FD2} - V_{FD1}$$

Where:
$V_{FD1}$ is the forward voltage of diode D1.
$V_{FD2}$ is the forward voltage of diode D2.
$V_{CNT}$ is the VCC Control Voltage.

![Figure 8. Back Converter Circuit (At MOSFET Turned OFF)](image)

At light load, the output voltage may rise because the VCC voltage is difference from the output voltage. In this case, it is necessary that the output pin is connected to resistor and the voltage should be lowered. The circuit diagram is shown in Figure 9.

![Figure 9. Circuit to Take Measure against Voltage Rising at Light Load](image)
6.1 Setting of the Output Voltage – continued

This IC has a few external parts by fixing the VCC voltage and it enables simpler design. If you adjust the output voltage, it can become the variable voltage by adding zener diodes. However, it is necessary to consider the dispersion of the diodes.

The output voltage VOUT is defined by the formula below. The voltage when the MOSFET is OFF is shown in Figure 10.

\[ V_{OUT} = V_{CNT} + V_{FD2} - V_{FD1} + V_{ZD1} \]

Where:
- \( V_{FD1} \) is the forward voltage of diode D1.
- \( V_{FD2} \) is the forward voltage of diode D2.
- \( V_{ZD1} \) is the zener diode ZD1 voltage.
- \( V_{CNT} \) is the VCC Control Voltage.

![Diagram of Back Converter Output Dispersion Circuit (At MOSFET Turned OFF)](image)

6.2 Frequency Circuit
- mode 1: burst operation
- mode 2: fixed frequency operation (It operates in maximum frequency.)
- mode 3: over load operation (pulse operation is stopped and burst operation is started.)

![Diagram of State Transition of Oscillation Frequency](image)

6.3 Frequency Hopping Function
Frequency hopping function achieves low EMI by change the frequency at random. The wave width of frequency’s upper limit is ±6 % for basic frequency.
6 DC/DC Driver – continued

6.4 PWM Error Amp and PWM Comparator
The internal error Amp achieves the reduction of external parts. In addition, this IC adopts current mode method. It makes the design easy.

6.5 Over Current Limiter
This IC has an internal over current limiter per switching cycle. This function monitors the coil current and if it exceeds a certain current, the IC stops switching. Additionally, an internal current detection resistor contributes to reduction of parts and improvement of efficiency. The peak current by which the IC switches to the over load mode is determined by the formula below.

\[
\text{Peak current} = I_{\text{PEAK}} + \frac{(V_{\text{DRAIN}} - V_{\text{OUT}})}{L} \times t_{\text{delay}}
\]

Where:
\( I_{\text{PEAK}} \) is the over current limiter internal the IC.
\( V_{\text{DRAIN}} \) is the DRAIN voltage.
\( V_{\text{OUT}} \) is the output voltage.
\( L \) is the Coil value.
\( t_{\text{delay}} \) is the Delay time after detection of over current limiter.

6.6 Dynamic Over Current Limiter
This IC has a built-in dynamic over current limiter. In case that coil current exceeds \( I_{\text{DPEAK}} \) (1.60 A Typ) two times consecutively, it stops pulse operation for \( t_{\text{DPEAK}} \) (128 µs Typ).

![Dynamic Over Current Limiter Diagram](image)

Figure 12. Dynamic Over Current Limiter
6 DC/DC Driver – continued

6.7 Soft Start Operation
At starting up, this function controls the over current limiter value in order to prevent any excessive voltage or current rising. The details are shown in Figure 13. The IC enables the soft start operation by changing the over current limiter value with time.

7 Output Over Load Protection Function (OLP comparator)
Output over load protection function monitors load status and stops switching at over load. In the over load condition, the output voltage lowers. If a state is electric power set in the IC or more continues for $t_{FOLP1}$ (128 ms Typ), the IC stops switching by judging the status as over load. The recovery after detection of OLP is $t_{FOLP2}$ (512 ms Typ) later.

8 Temperature Protection Circuit
Temperature protection circuit stops the oscillation of DC/DC if the IC becomes more than a certain temperature.
9 Operation Mode of Protection Circuits

The operation mode of protection functions is shown in Table 1.

Description of Blocks – continued

10 External Components

Each part should be designed considering the input voltage condition and output load condition. Figure 14 shows application circuit.

![Application circuit diagram](image)

**Figure 14. Application circuit**

10.1 Output Capacitor $C_{OUT}$

Output capacitor $C_{OUT}$ should be designed considering the spec of output ripple voltage and to startup until $t_{FOLP1}$ (128 ms Typ). It is recommended to be 100 μF or more.

10.2 Inductor $L$

The value of inductor should be designed considering the spec of output load condition and the input voltage range. If inductor value is too large, dc/dc operation becomes continuous mode and increases heat. If inductor value is too small, it is impossible that the IC controls in the Minimum ON width $t_{MINON}$ or less, so there is a possibility of over current detection at normal operation load. It is recommended to be 270 μH to 680 μH.

10.3 VCC Pin Capacitor $C_{VCC}$

The VCC pin Capacitor $C_{VCC}$ adjusts startup time and response of Error AMP. It is recommended to design less than 1/100 value of $C_{OUT}$.

10.4 Capacitor between the DRAIN Pin and the GND_IC Pin $C_{D-S}$

It is recommended to design the capacitor between the DRAIN pin and the GND_IC pin $C_{D-S}$ less than 22 pF.

</tbody>
</table>

**Caution 1:** Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

**Caution 2:** Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, design a PCB with power dissipation taken into consideration by increasing board size and copper area so as not to exceed the maximum junction temperature rating.

(Note 1) Derate by 4.563 mW/°C when operating Ta=25 °C or more when mounted (on 70 mm x 70 mm x 1.6 mm thick, glass epoxy on single-layer substrate).

### Thermal Loss

The thermal design should set operation for the following conditions.

1. The ambient temperature Ta must be 105 °C or less.
2. The IC's loss must be within the Power Dissipation Pd.

The thermal abatement characteristics are as follows.

(PCM: 70 mm x 70 mm x 1.6 mm single layer board, the back side is copper foil)

Non Connection | Non Connection | GND IC | Non Connection
Operational Notes

1. **Reverse Connection of Power Supply**
   Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC’s power supply pins.

2. **Power Supply Lines**
   Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. **Ground Voltage**
   Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. **Ground Wiring Pattern**
   When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. **Recommended Operating Conditions**
   The function and operation of the IC are guaranteed within the range specified by the recommended operating conditions. The characteristic values are guaranteed only under the conditions of each item specified by the electrical characteristics.

6. **Inrush Current**
   When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

7. **Testing on Application Boards**
   When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC’s power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

8. **Inter-pin Short and Mounting Errors**
   Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

9. **Unused Input Pins**
   Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.
Operational Notes – continued

10. **Regarding the Input Pin of the IC**
    This IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

    When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.
    When GND > Pin B, the P-N junction operates as a parasitic transistor.

    Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

![Figure 16. Example of IC Structure](image)

11. **Ceramic Capacitor**
    When using a ceramic capacitor, determine a capacitance value considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

12. **Thermal Shutdown Circuit (TSD)**
    This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF power output pins. When the Tj falls below the TSD threshold, the circuits are automatically restored to normal operation.

    Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

13. **Over Current Protection Circuit (OCP)**
    This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

Notice

Precaution on using ROHM Products

1. Our Products are designed and manufactured for application in ordinary electronic equipment (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment \(^{(Note\,1)}\), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM’s Products for Specific Applications.

\(^{(Note\,1)}\) Medical Equipment Classification of the Specific Applications

<table>

<td></td>
</tr>
</tbody>
</table>

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:

[a] Installation of protection circuits or other protective devices to improve system safety
[b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM’s Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:

[a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
[b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
[c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl\(_2\), H\(_2\)S, NH\(_3\), SO\(_2\), and NO\(_2\)
[d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
[e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
[f] Sealing or coating our Products with resin or other coating materials
[g] Use of our Products without cleaning residue of flux (Exclude cases where no-clean type fluxes is used. However, recommend sufficiently about the residue.) ; or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
[h] Use of the Products in places subject to dew condensation

4. The Products are not subject to radiation-proof design.

5. Please verify and confirm characteristics of the final or mounted products in using the Products.

6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse, is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8. Confirm that operation temperature is within the specified range described in the product specification.

9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification
Precautions Regarding Application Examples and External Circuits
1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic
This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation
1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
   [a] the Products are exposed to sea winds or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂;
   [b] the temperature or humidity exceeds those recommended by ROHM
   [c] the Products are exposed to direct sunshine or condensation
   [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label
A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition
When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act
Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights
1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution
1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.
General Precaution
1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM’s Products against warning, caution or note contained in this document.

2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM’s Products, please confirm the latest information with a ROHM sales representative.

3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
